Experience

6+ years **shipping B2B SaaS** solutions that make complex data accessible and actionable. I believe in radical transparency, rapid iteration, and user collaboration.

Product Designer 2021 - 2025

- Led design across Klaviyo’s predictive revenue insights and AI-driven data quality tooling.
- Built workflows for identity resolution, troubleshooting and duplicate-profile detection.
- Redesigned Klaviyo’s Customer Profile architecture to improve data access and discoverability.
- Refined profile workflows reducing clicks and time on task by defaulting repetitive actions and removing data where irrelevant.

Founding Product Designer 2020 - 2021

- Designed and shipped the end-to-end mobile ordering experience, driving adoption, conversion, and repeat purchases across food truck partners.
- Partnered with founders on product vision, brand, and early growth strategy; Raised \$600K seed round supporting fundraising through prototypes and pitch materials.
- Expanded revenue per user, increasing Average Order Value (AOV) by 25%, by embedding strategic upsell loops and personalized recommendations into the ordering journey.

Project Samples

Q3 2025

AI Insights Dashboard

Introduced revenue as a system metric with an end-to-end predictive insight experience

Scope and Collaboration:

- Led product vision and launch strategy across high-value account rollout
- Contributed new components and UX pattern to our design system.
- Partnered with Data Science & Infra to define predictive models and UX workflows

Adoption

↑ 43%

of accounts viewed insights
32% activated at least one
6.5K weekly insight views

Time-to-Action

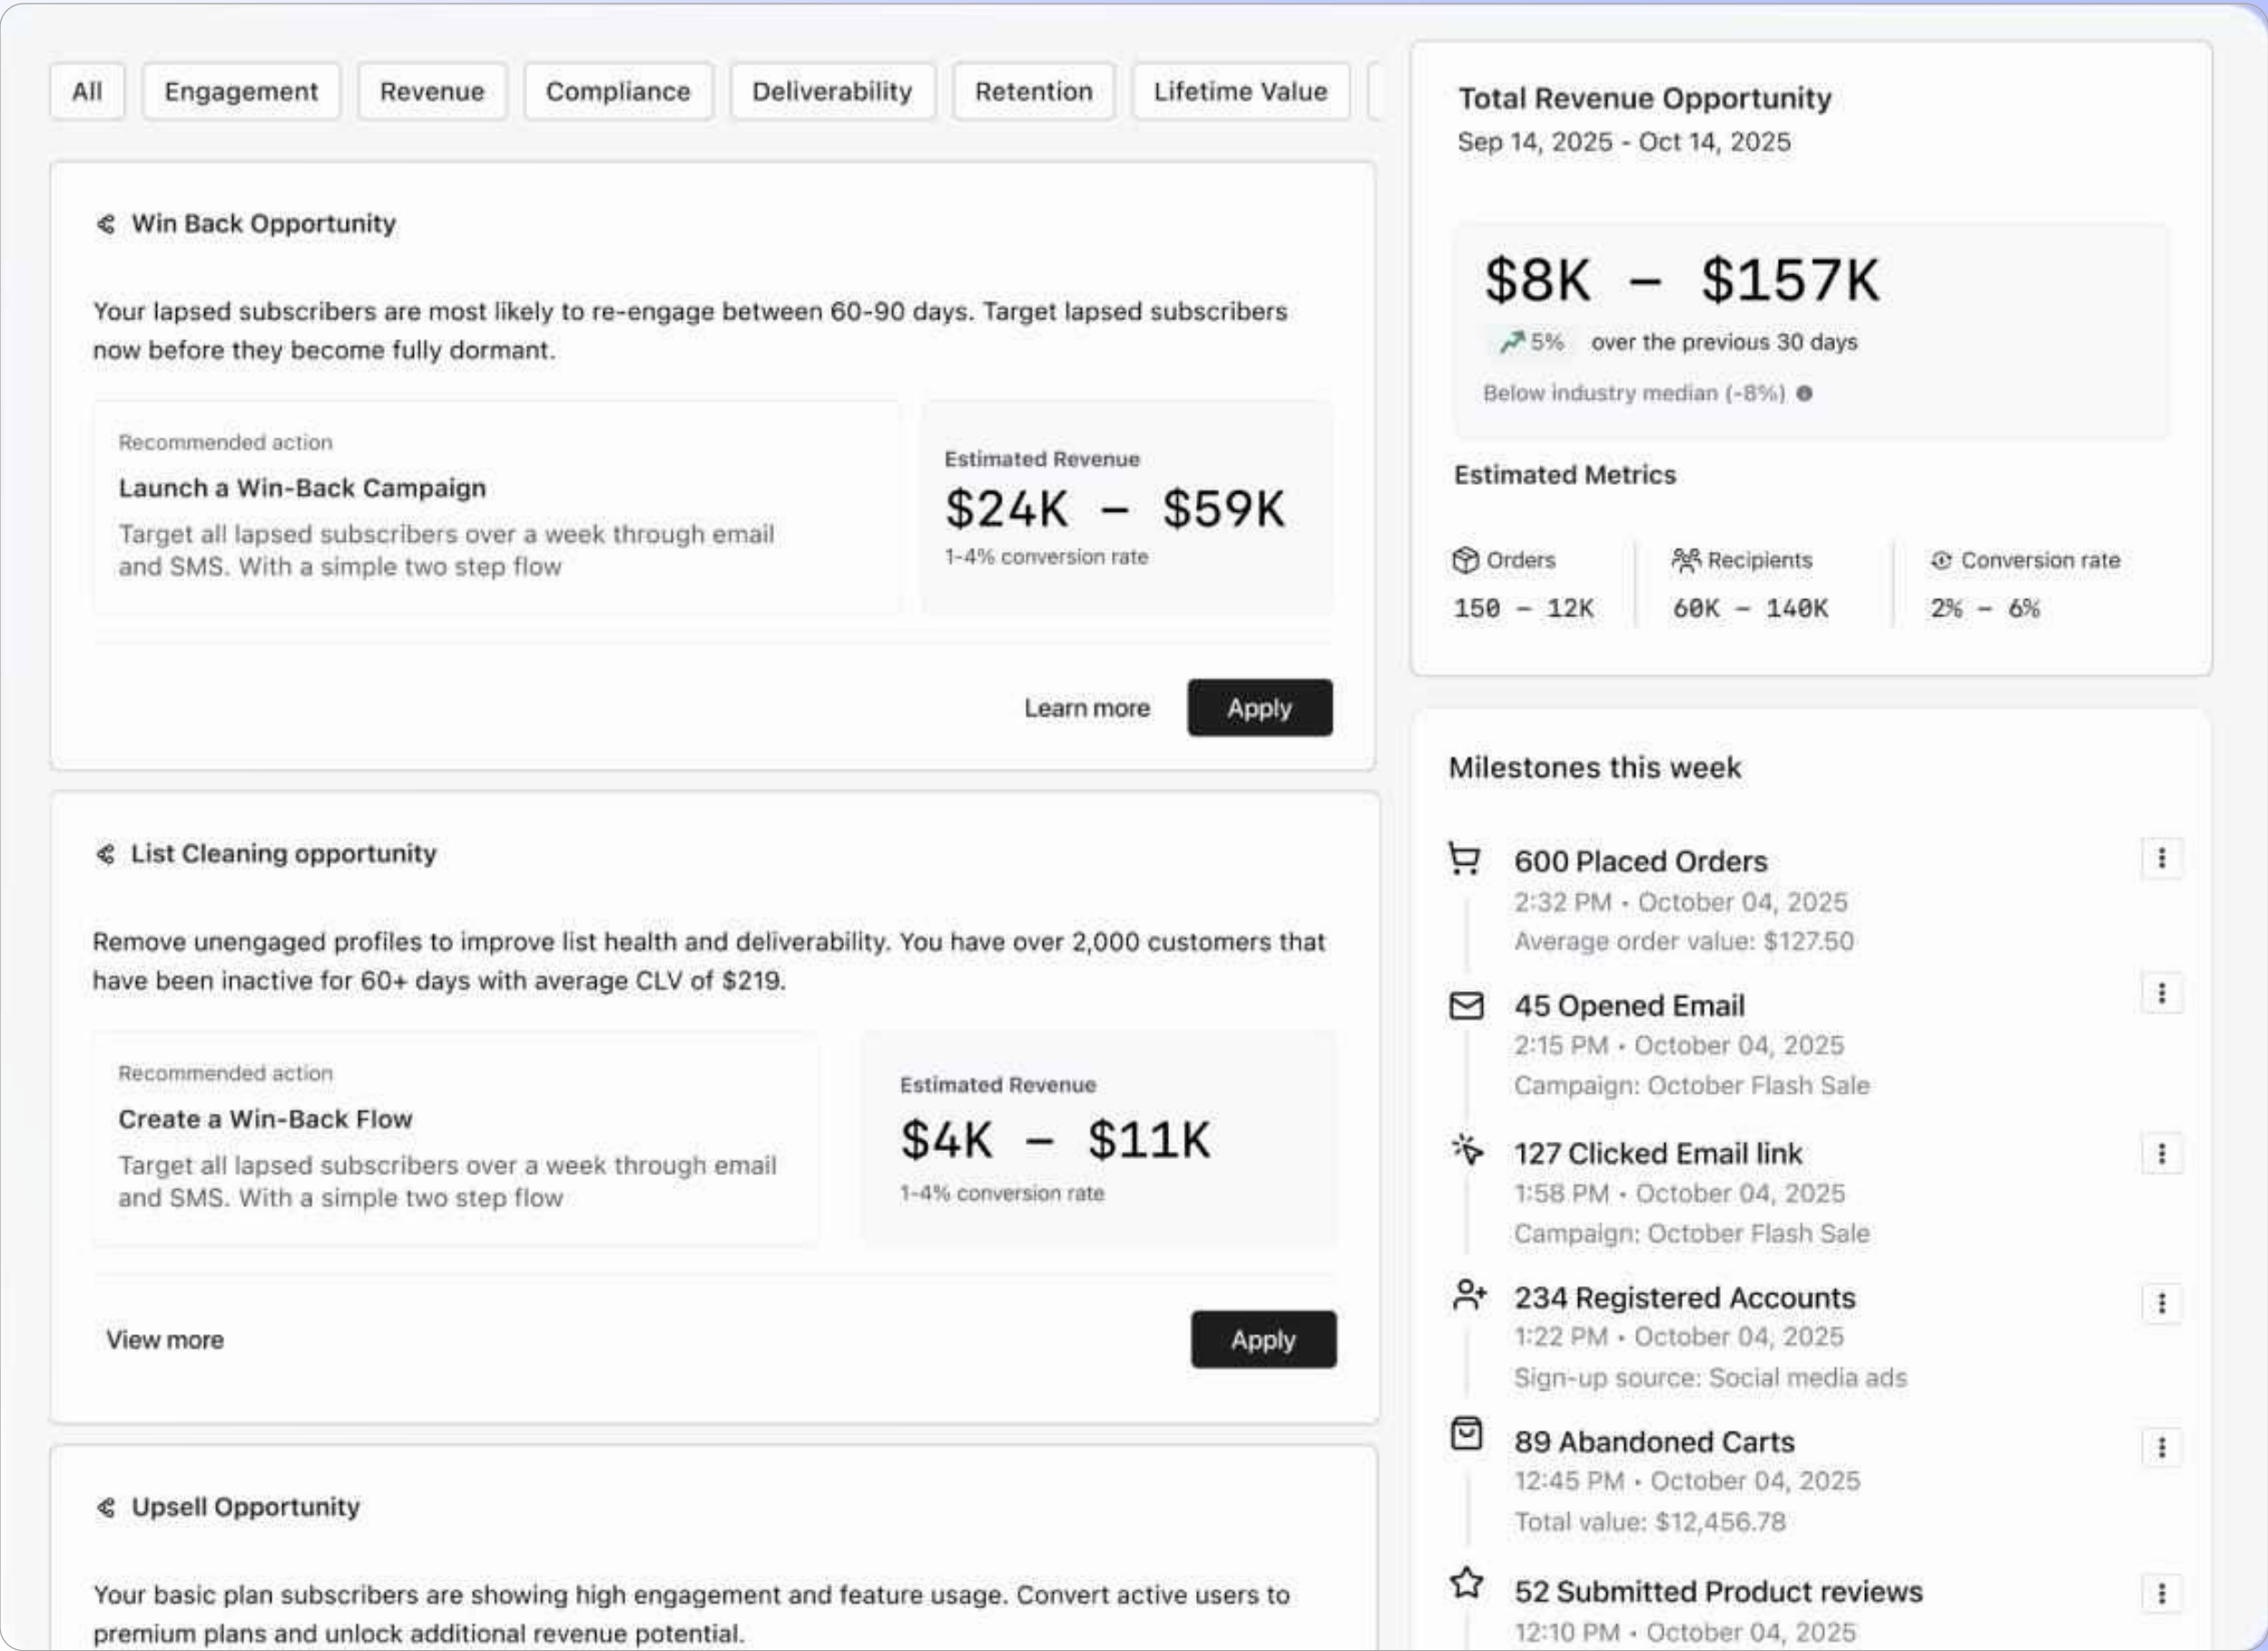

↑ 37%

5.1 → 3.2 days
Avg. time to launch

Attributed Value

↑ 18%

~2K MAUs
20% of \$50K+ ARR customers

Q2 2025

CX Center

Consolidated Klaviyo Academy, Live Training, Community, developer resources, and support content into a single WordPress-based hub so customers could find help without moving between sites.

Scope and Collaboration:

- Inherited Phase 1 mid-project, refined the existing designs, rebuilt the experience in WordPress, and supported the launch.
- Partnered with Marketing and Integrated Media to align the content, brand presentation, and CMS implementation.
- Extended the marketing design system with reusable search and content cards for credentials and support resources.

Access Points	Support Tickets	Adoption
6→1	↓ ~15%	↑ 40%
Streamlined fragmented support resources into one starting point	Estimated reduction in CX Center-related support tickets	Estimated increase in customers using the redesigned experience

*Directional estimates based on internal project observations.

Q1 2025

Data Quality & Deduplication

Launched AI detection for fraudulent profiles, cutting customer costs by 24% and improving deliverability across the board.

Scope and Collaboration:

- Led product strategy, defined vision and designed proof of concept.
- Introduced AI detection patterns to data hygiene tools, increasing deliverability while reducing cost.
- Owned senior leader alignment, communication and collaboration.

Total Adoption

↑ 88%

15k MAUs in Q1
of eligible enterprise accounts

Cost Savings

↑ 24%

\$2.4M
annualized savings

Data Hygiene

↑ 42%

Q3 2022

Customer profiles redesign

Restructured the information architecture of the profiles workspace, optimizing workflows and reducing time-on-task.

Scope and Collaboration:

- Architected the vision and rollout strategy for the modern profiles experience
- Overhauled 12 data hygiene workflows driving a 30% drop in task time.
- Created and contributed 12+ scalable components to the Design System

Profiles NPS

↑ 12+

Q2 2021

Mobile Ordering App

Cut user abandonment by 40% and boosted AOV by 25% by optimizing the mobile checkout flow with strategic upsells.

Scope and Collaboration:

- Led 0-to-1 design strategy for the mobile platform, focusing on friction-free checkout.
- Implemented strategic upsell placements and personalized recommendations, driving a 25% lift in average order value.
- Redesigned order confirmation and modification flows, resulting in a 30% decrease in support tickets.

Customer Profiles Redesign

How I turned a code migration into a product strategy **saving marketers 3hrs a week**

Ahead of the Klaviyo IPO, engineering kicked off a company wide React migration. Profiles sat on a legacy framework that had drifted into inconsistent UI patterns and high friction journeys. I led a sprint that exposed the usability gaps and prototyped what the surface could become, then made the case to leadership that a 1:1 react migration would ship the same problems in new code. They approved a full redesign.

Scope and Collaboration:

- Led IA strategy and the three pillar vision across individual profile, data quality, and predictive analytics
- Ran a 22 participant research study with 10 internal and 12 external stakeholders
- Partnered with Data Science, Engineering, Support, and Research through the pre IPO React conversion

Background & Context

Context

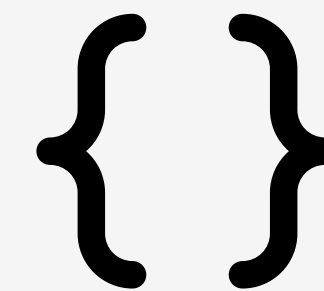

What?

Engineering led a company-wide migration of our front-end stack from Backbone to React

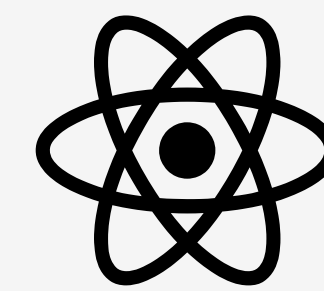

Why?

To align our platform with international standards ahead of IPO.

Technical Migration

Back bone

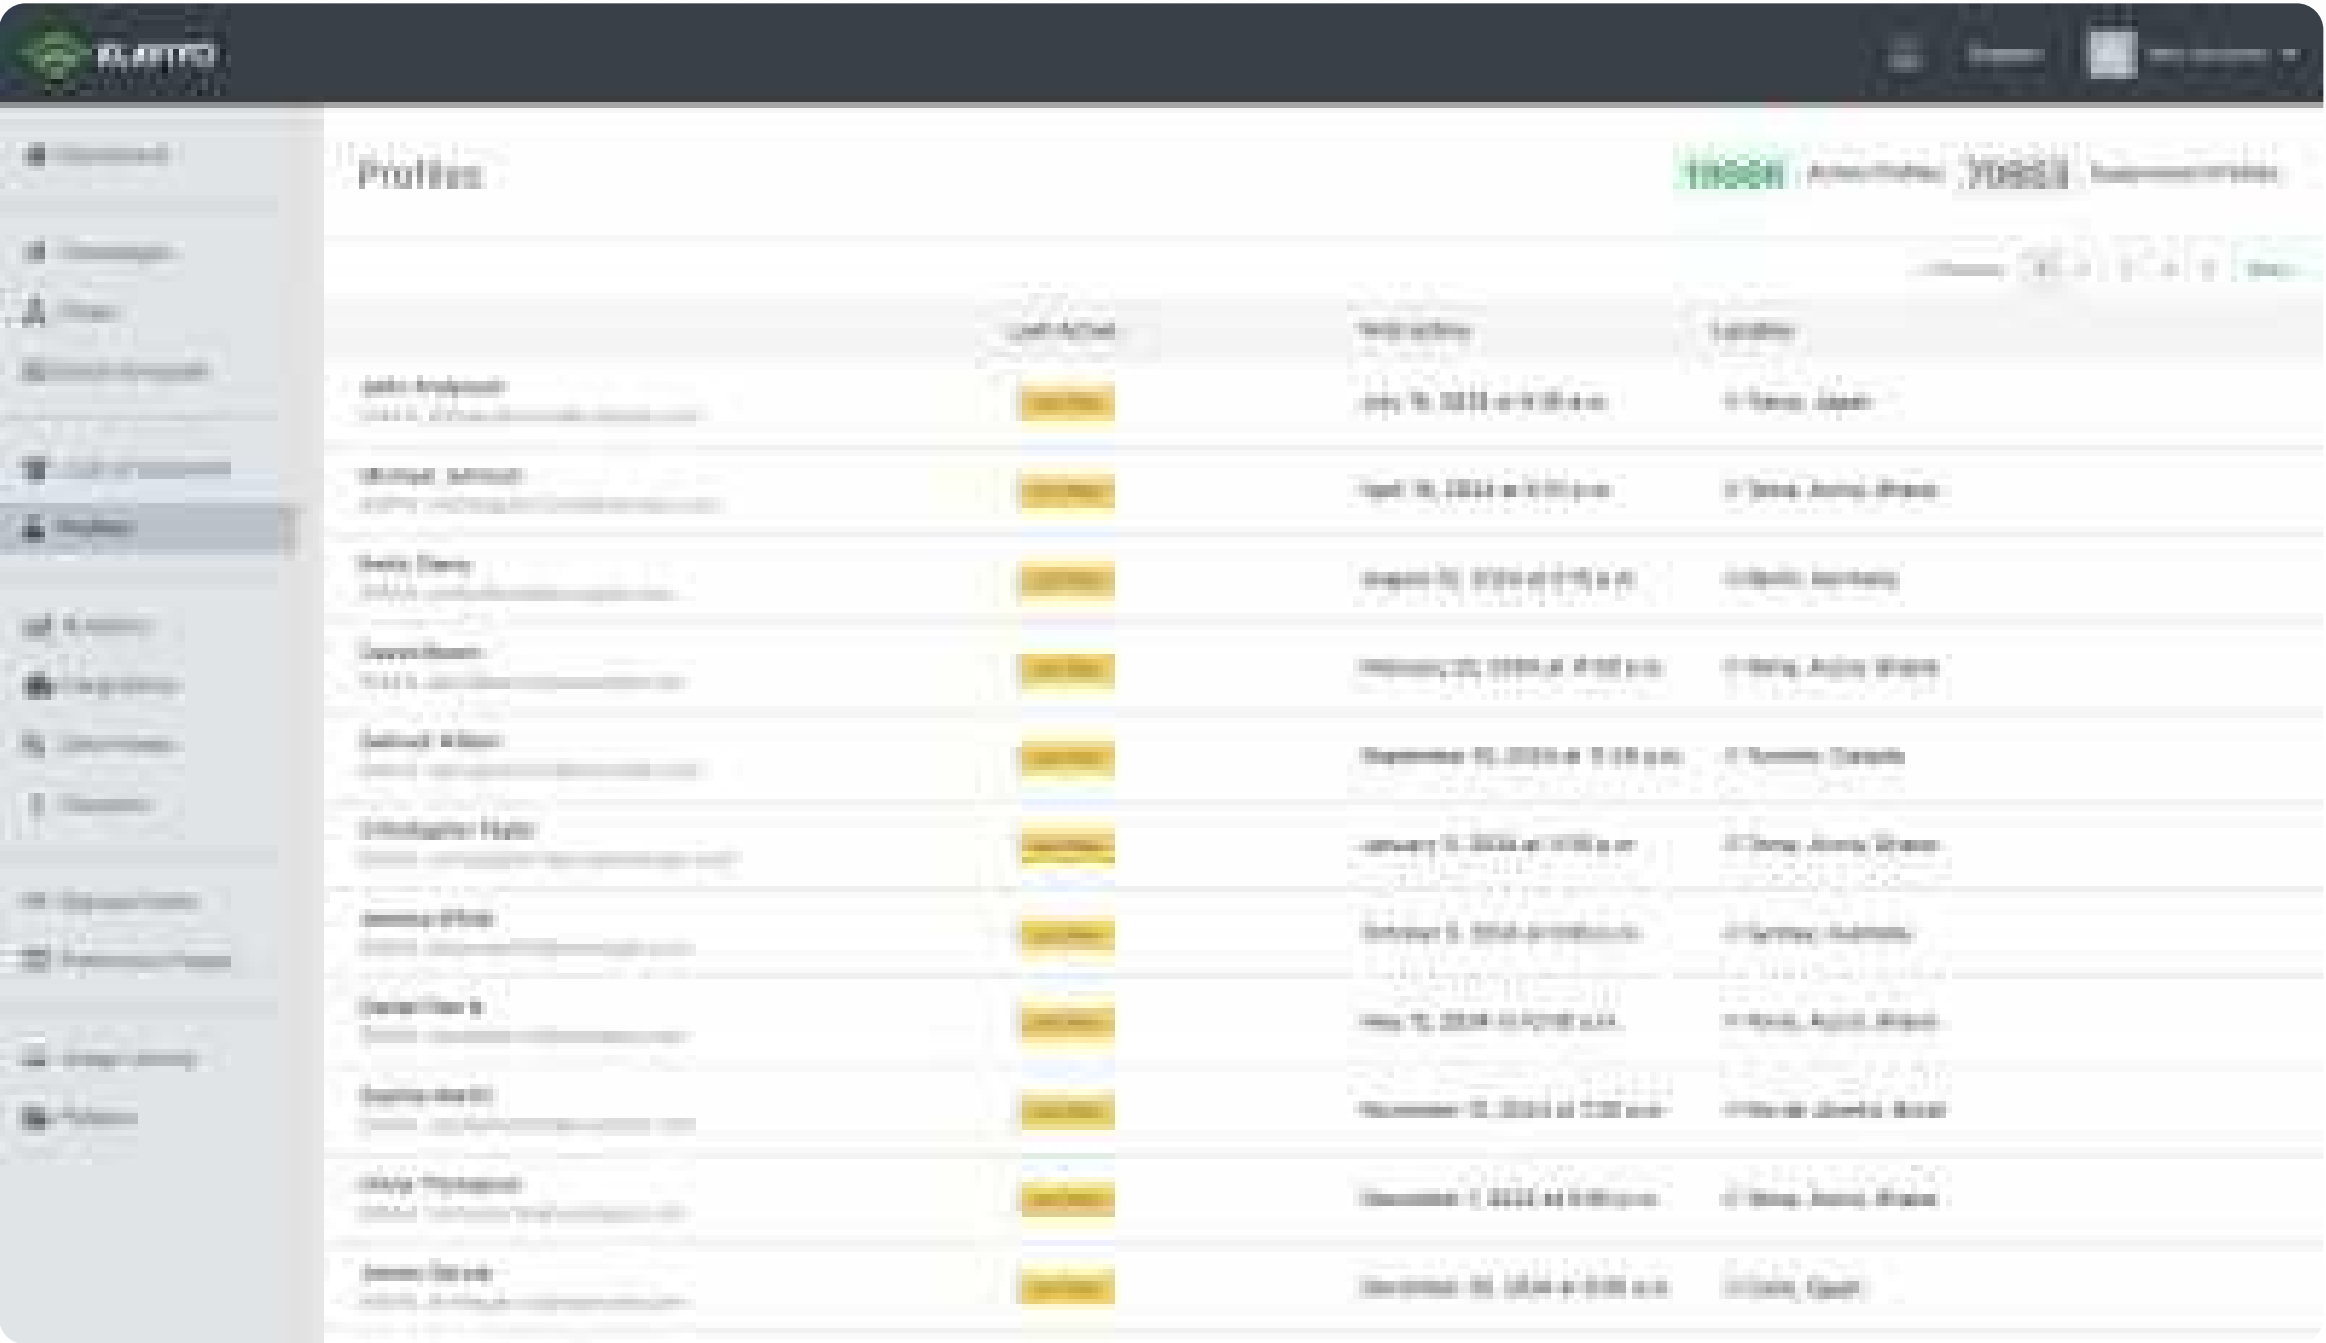

React

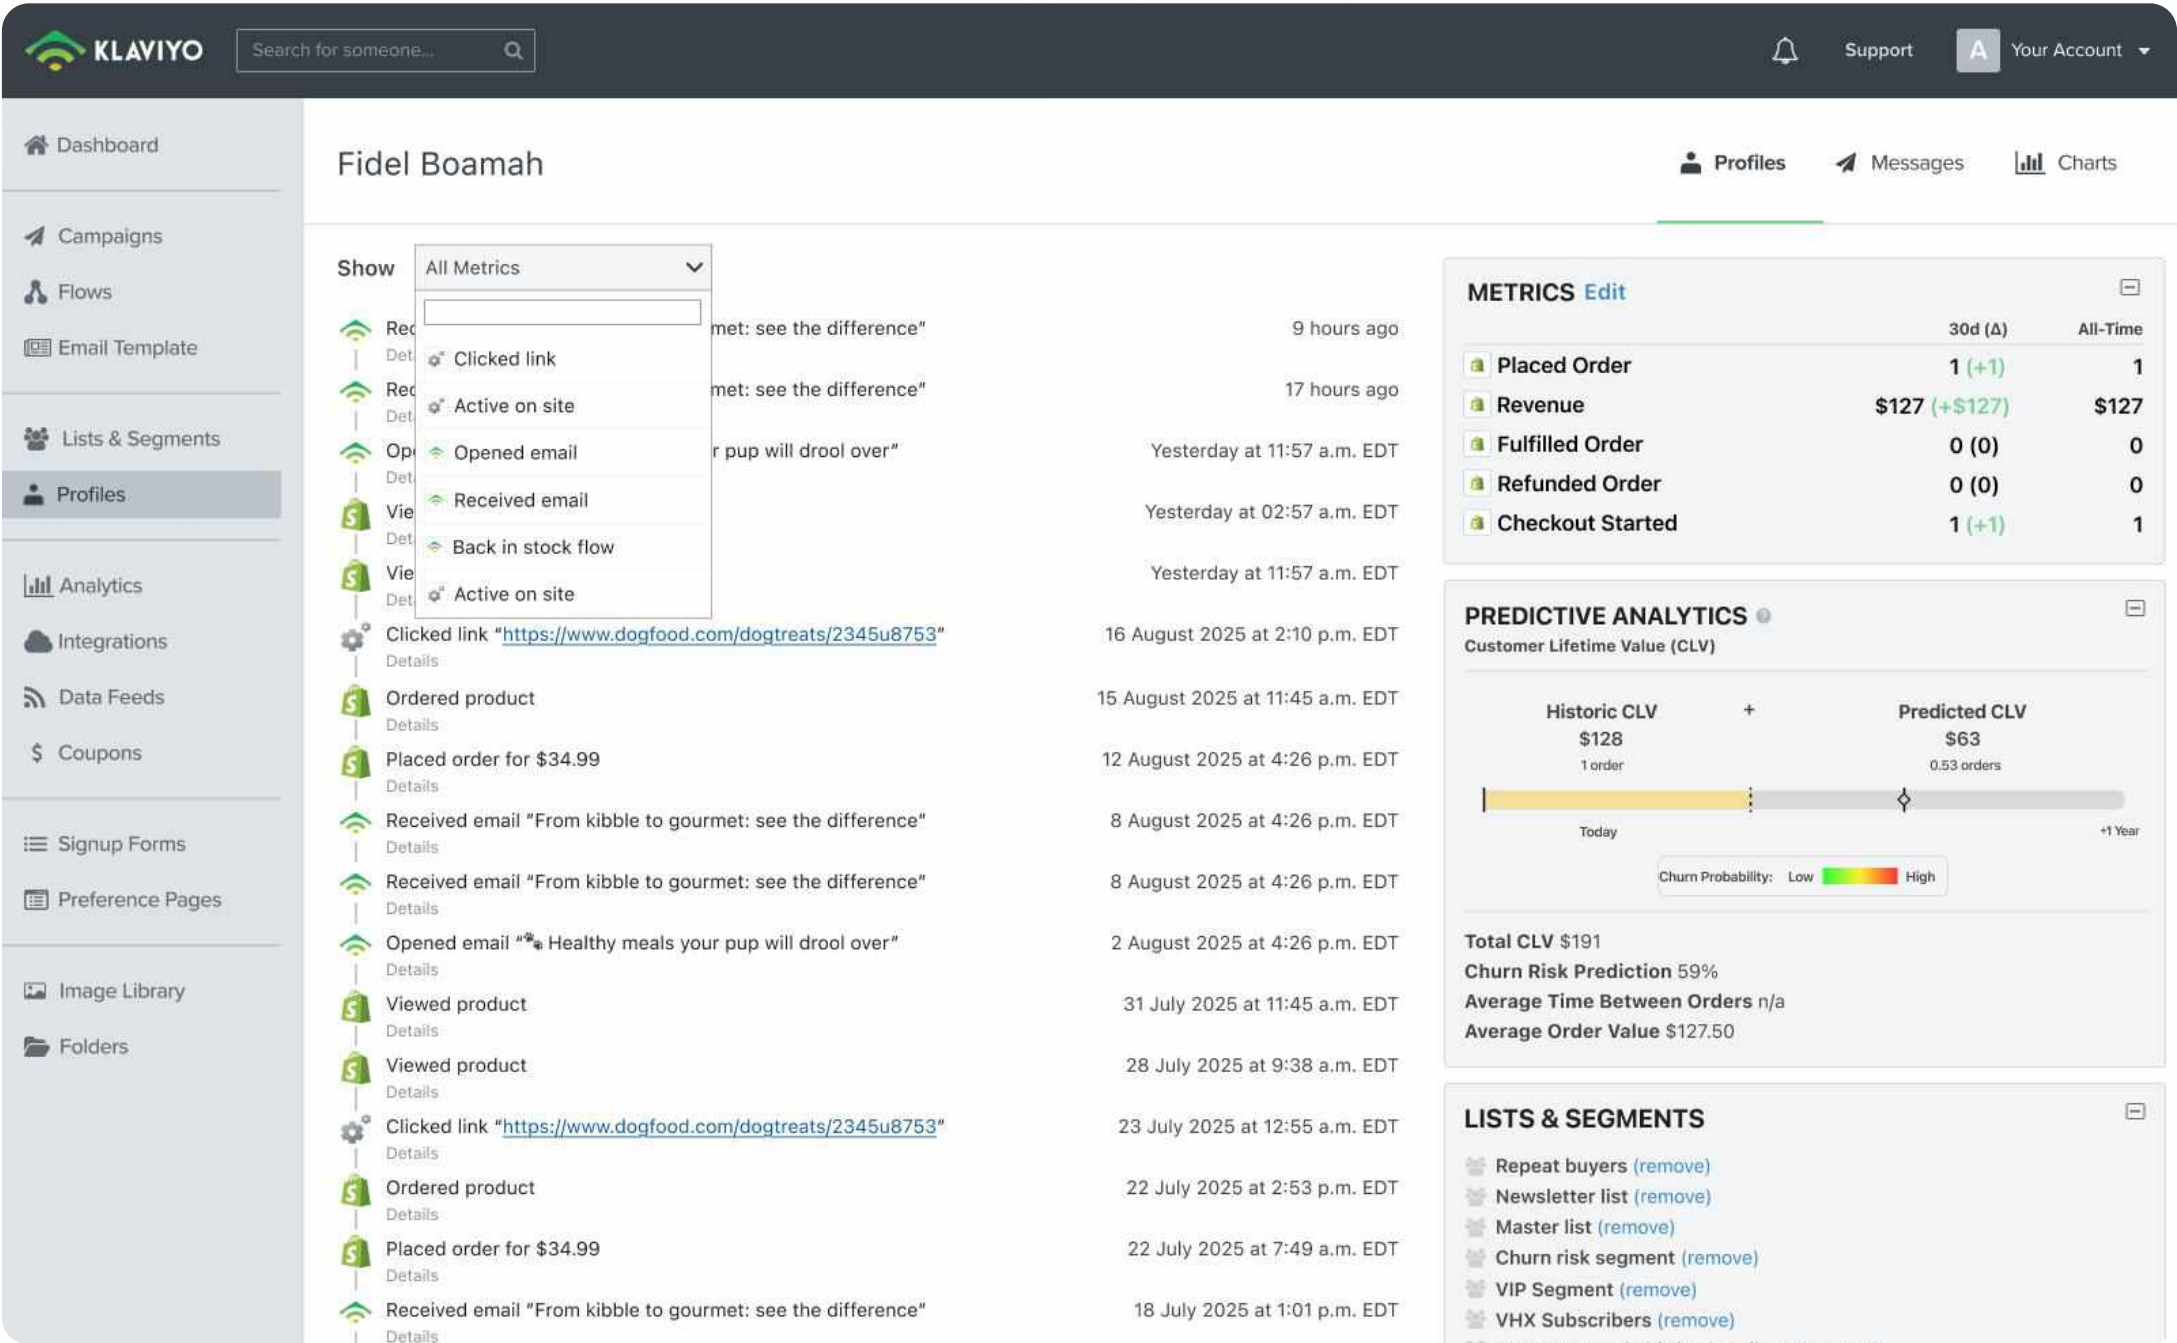

Context

Profiles relied on a legacy framework that resulted in inconsistent UI patterns and high-friction user journeys.

Profiles Home Page

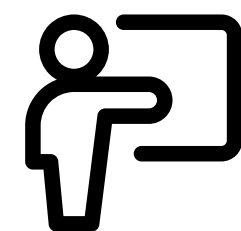

Customer Page

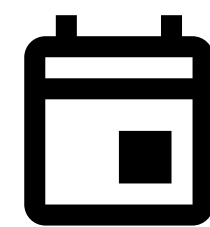

Speaking to users

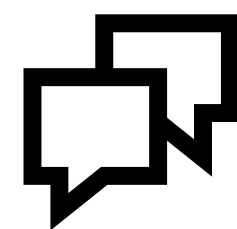

I led a sprint that revealed major usability gaps and explored potential solutions to improve the existing profiles experience

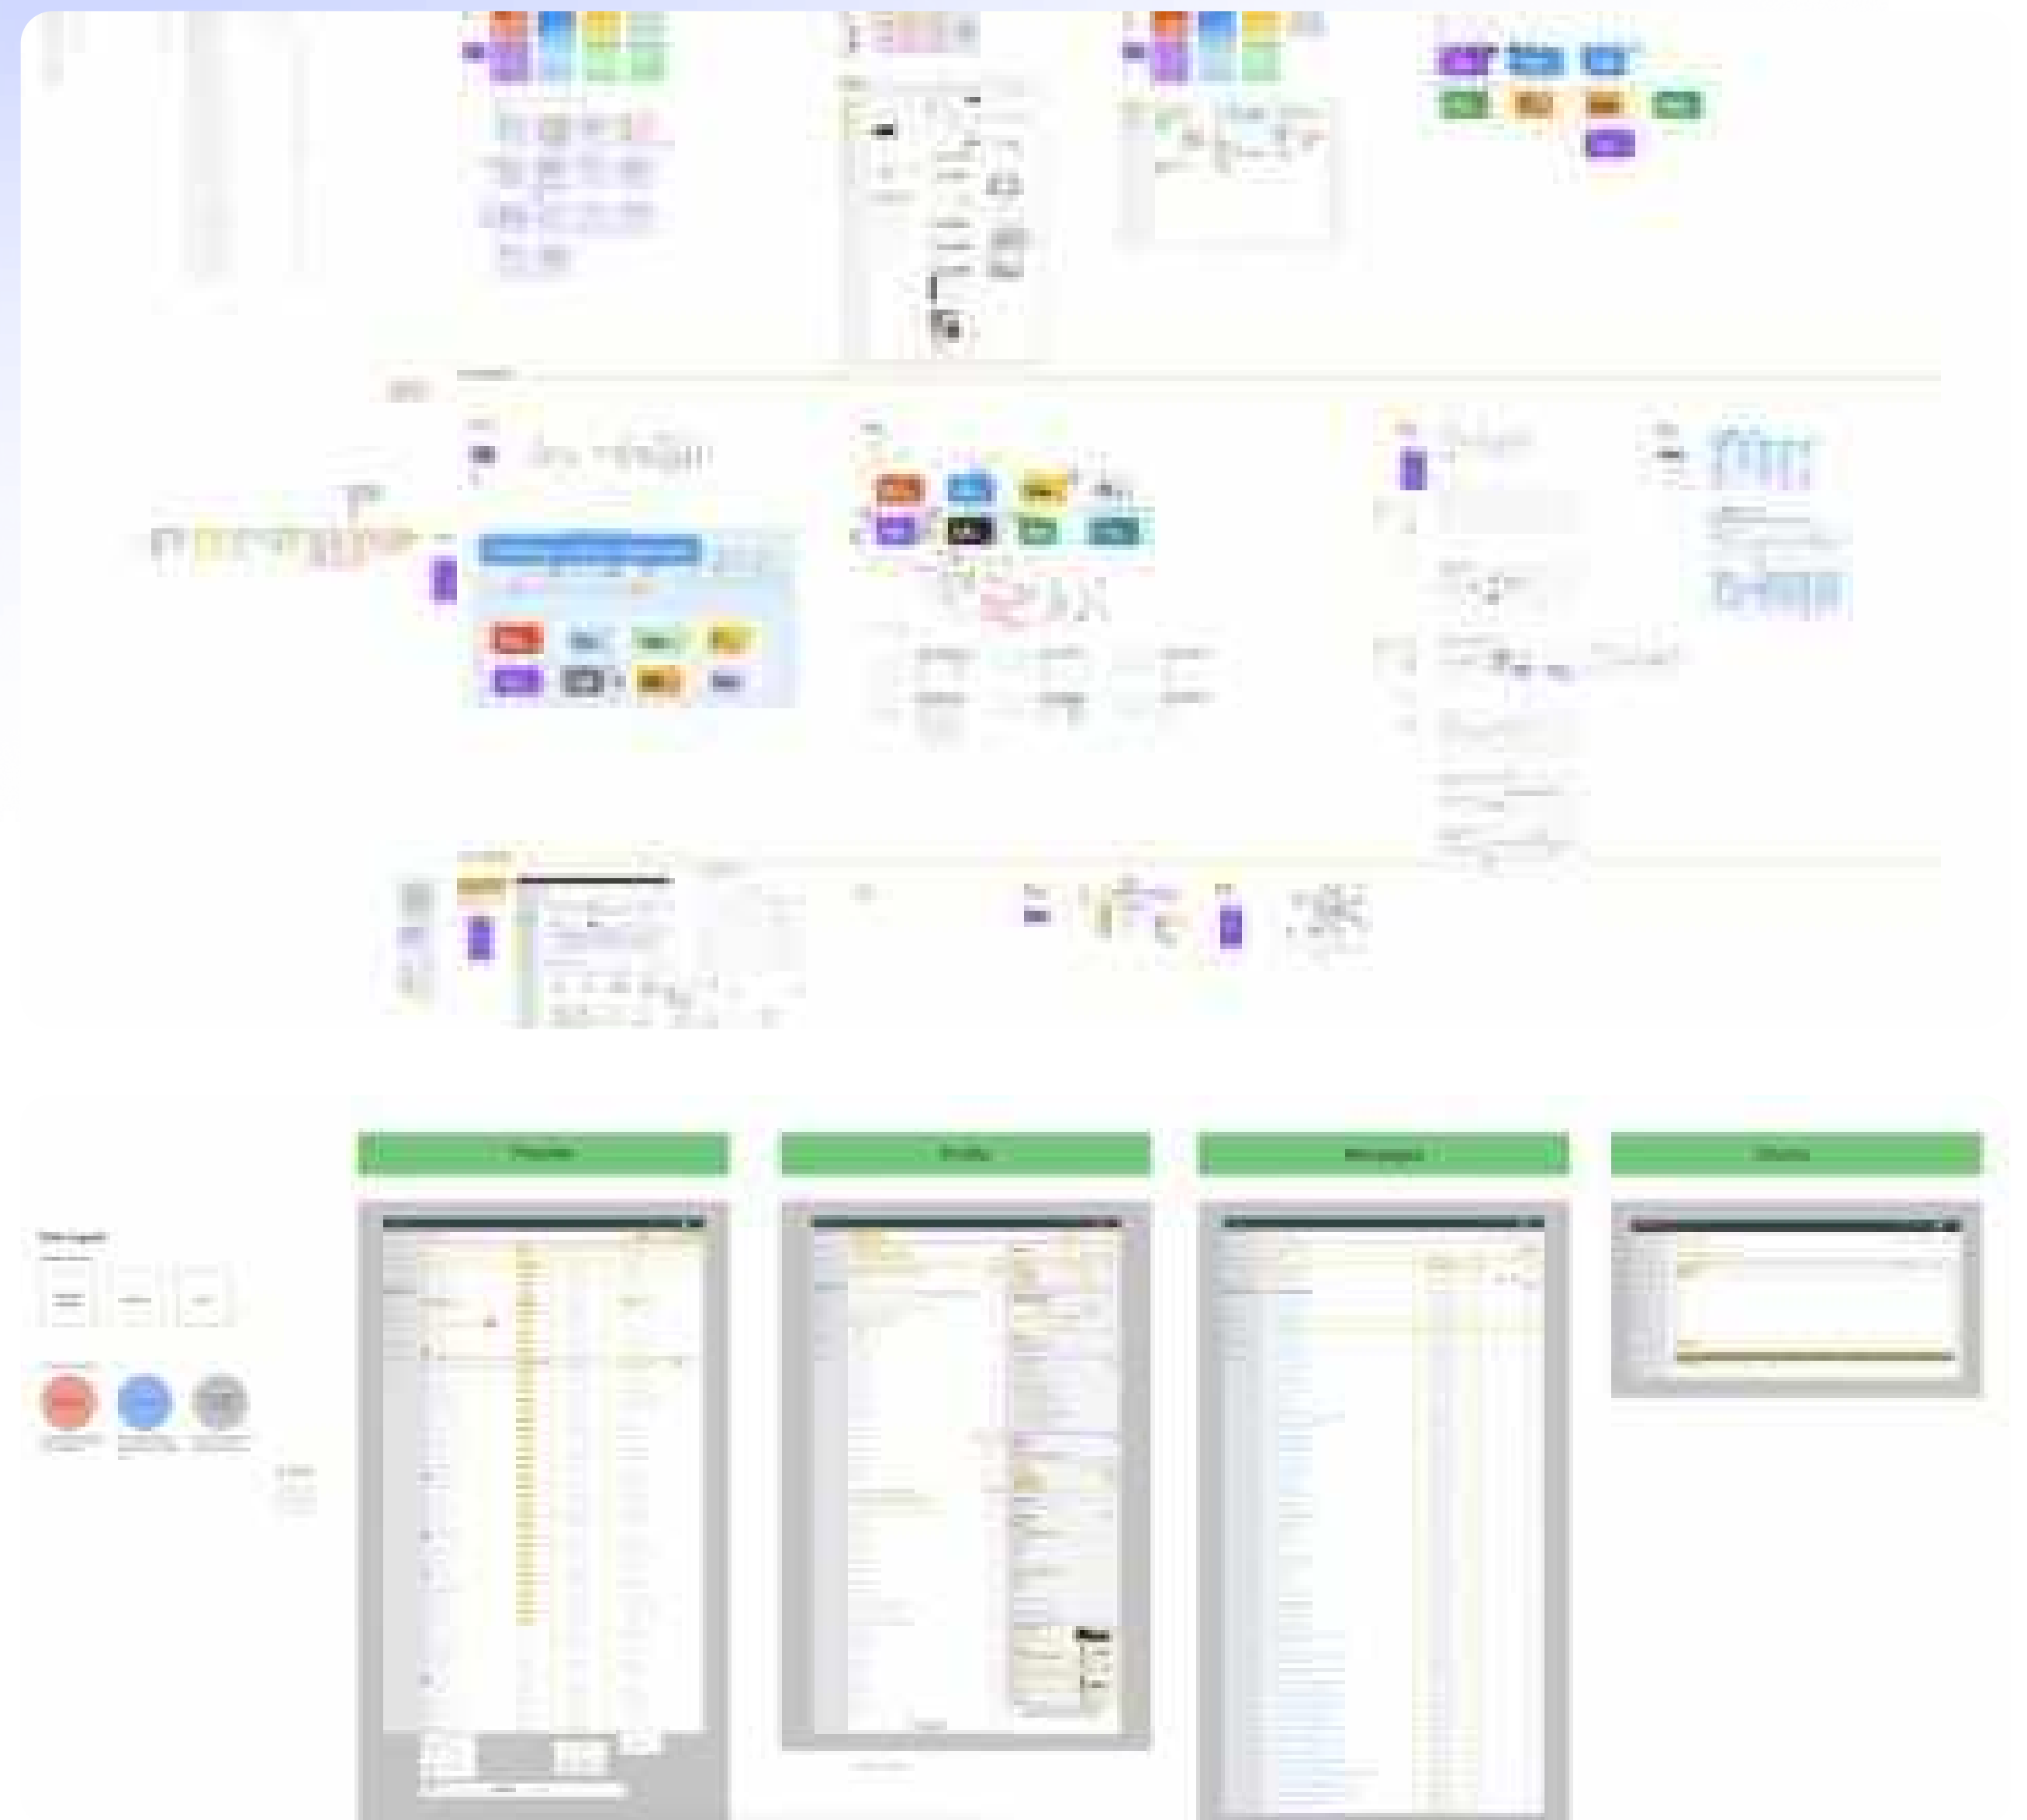

Workshop

3 Week Sprint

22 User Interviews

User Persona

The Troubleshooter

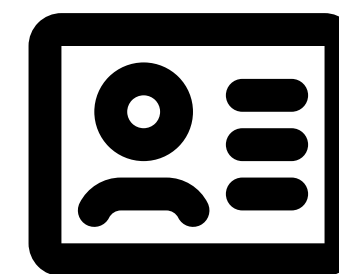

This is someone who enters a profile to resolve issues, verify data, or confirm status rather than explore analytics

User Goal

Searching

Workflows designed to identify profiles and key data

Understanding

Data that paints a clear picture of customers relationship to the business

Business Case

I quantified the business impact of inefficiencies in profile workflows

And provided solutions that improves speed and enables a scalable customer experience.

Revenue Potential

\$10-15M

In operational savings

Profile counts

Old experience displayed counts for email profiles that are active and suppressed - this didn't account for SMS and other channels which was very misleading. As a result, we had many billing issues raised because of the lack of clarity here

No search

Savvy Marketers had to rely on Cmd+f but even that doesn't work with paginated tables. Imagine the stress of finding a user.

Challenges

- Information overload: There's too much information at once
- No filter/search: Can't search for specific data except through CMD + F
- Poor information architecture:

50% of troubleshooting data and tools is buried below the fold

- Consent Status
- Profile Actions
- Contact Information

Iterations and Testing

Layout 1

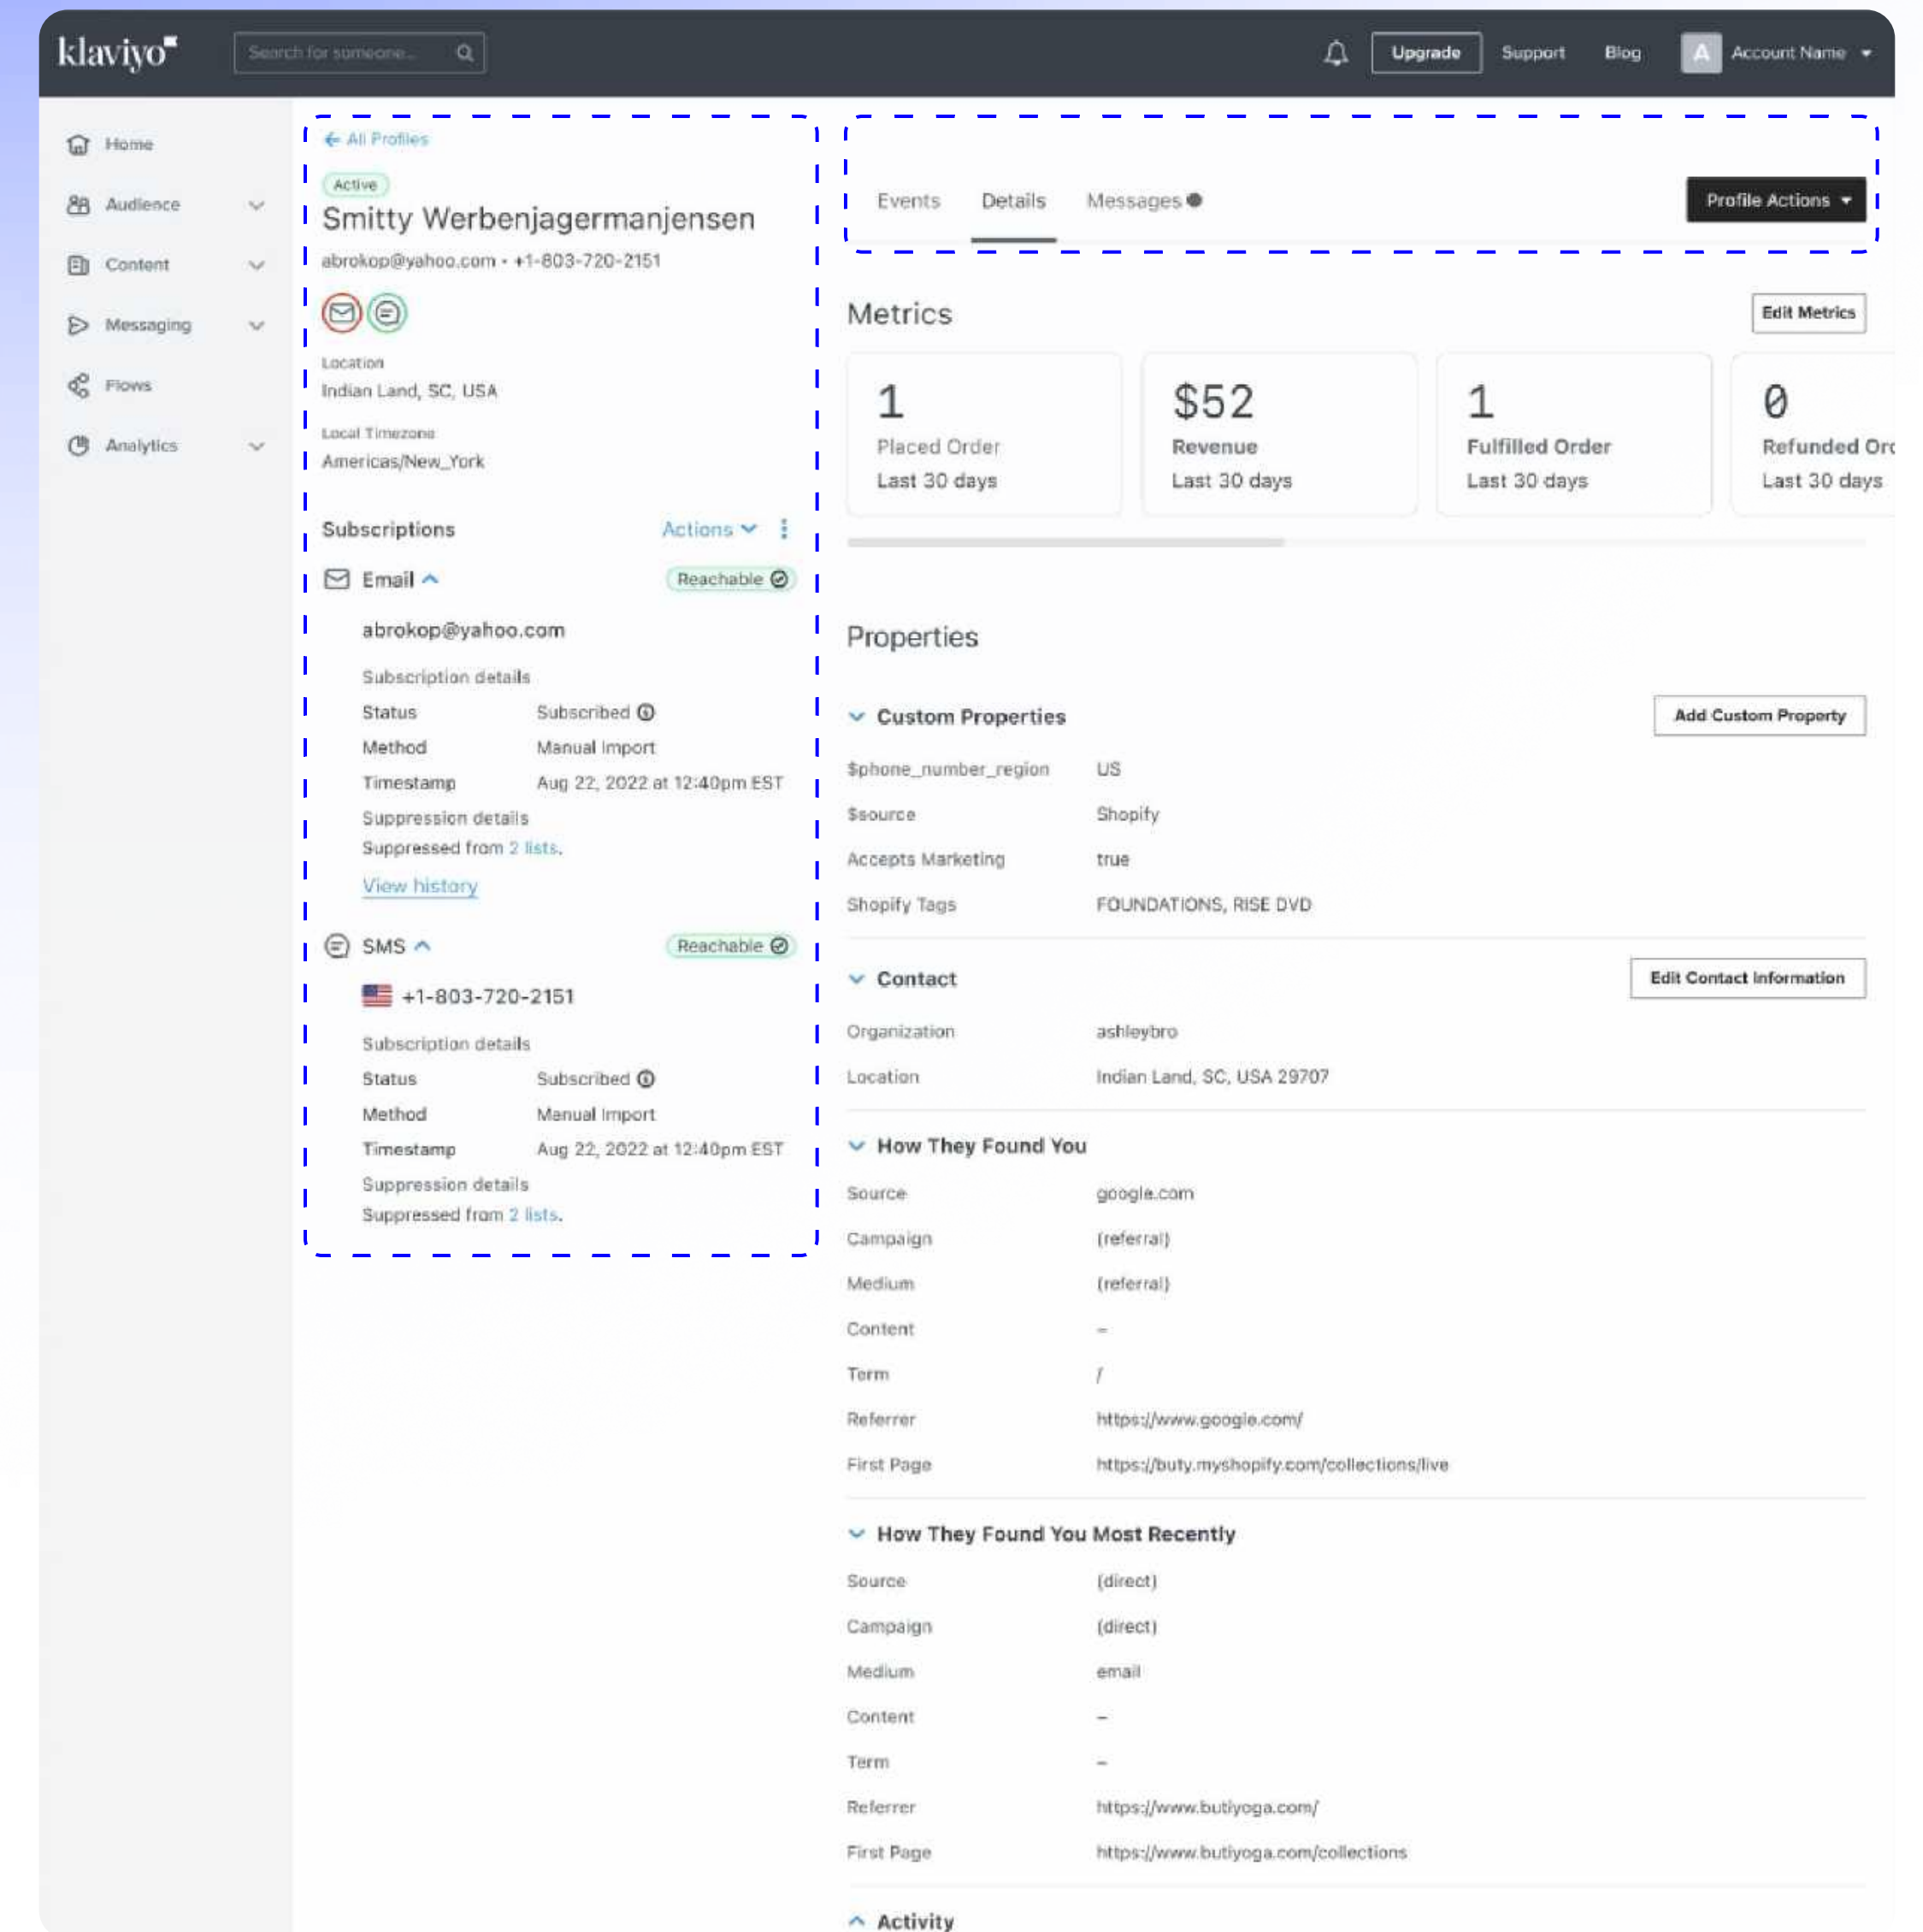

Layout 1 kept profile details front and center, but tab switching broke the troubleshooting flow.

What we tried

- A persistent left column so core profile details stayed visible throughout the session
- Profile properties grouped into readable sections under a tab structure

Why it didn't hold

- Testing showed users constantly switching between the Events tab and other properties, which interrupted troubleshooting.
- The vertical header fell outside our design system patterns, so it wasn't a viable option

Layout 2

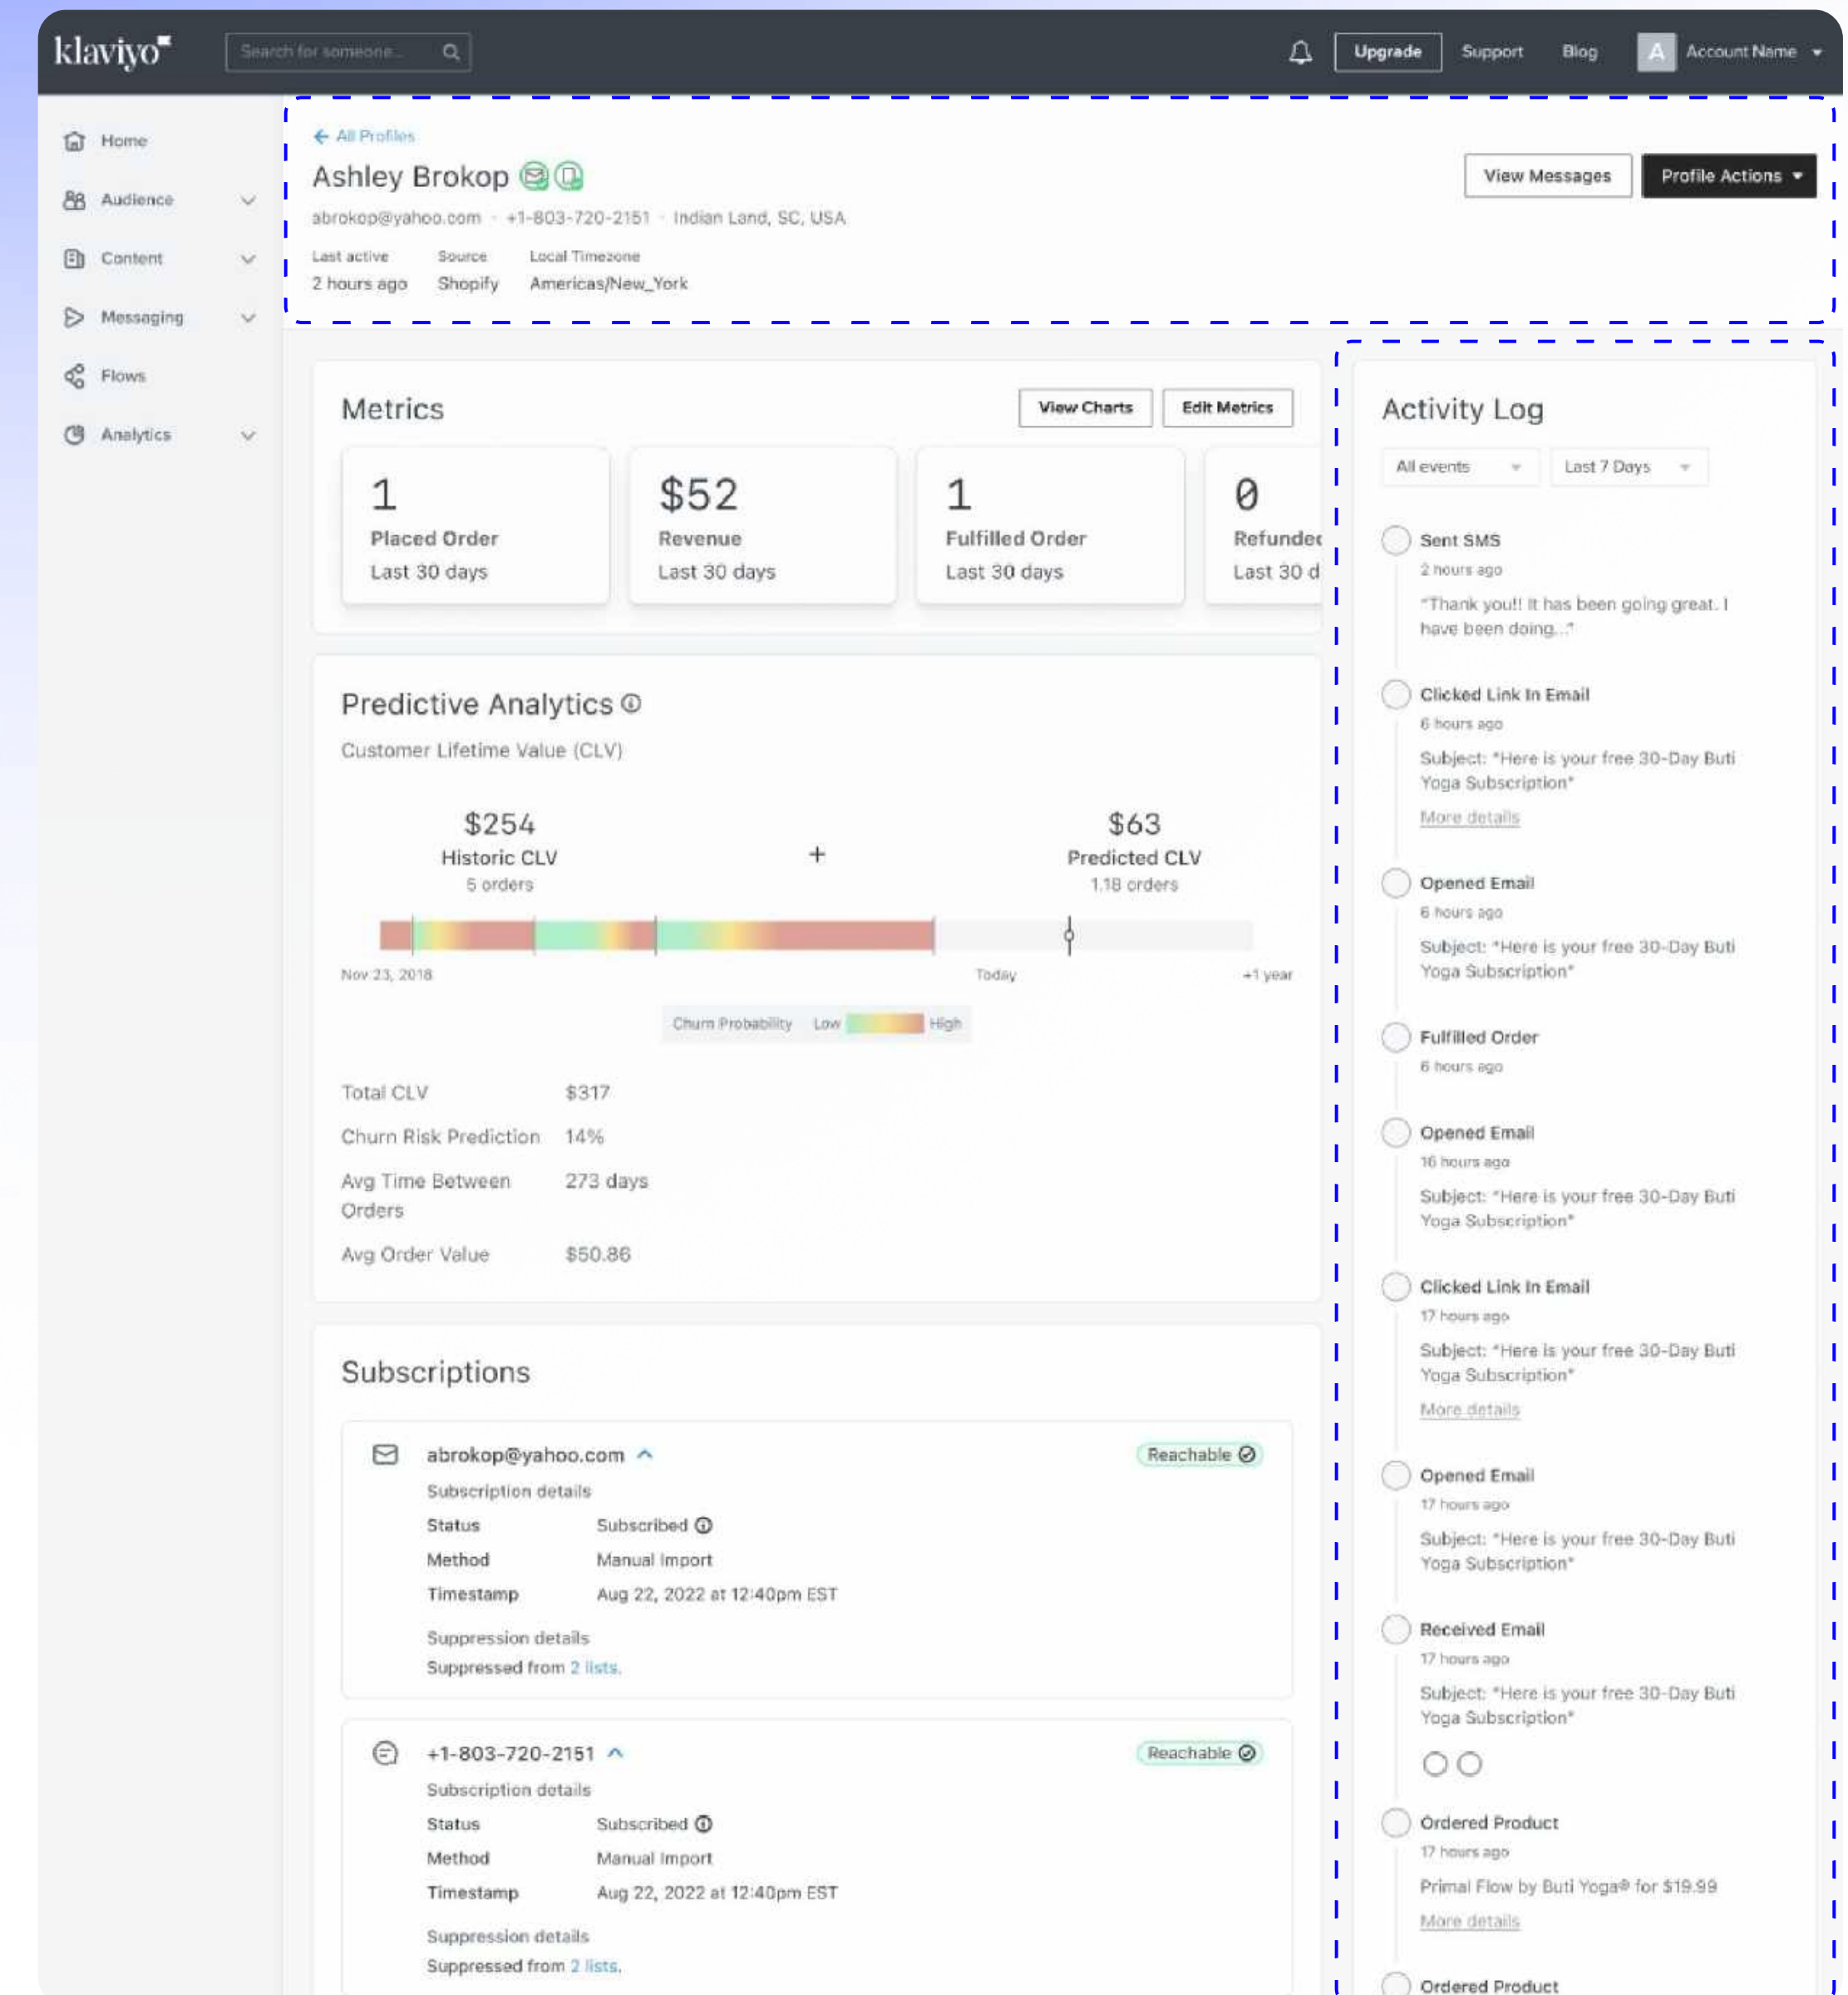

Layout 2 fixed the flow problem, but losing tabs left the data with nowhere to hide.

What we tried

- A persistent activity log so events stayed on screen throughout a session
- A redesigned page header built as a design system compliant component
- Removal of the tab structure, which solved the constant switching from Layout 1

Why it didn't hold

- Without tabs there was no mechanism for prioritizing or organizing the data, so everything sat at the same level of importance
- Users scrolled further to find what they needed, and time on task went up

Layout 3

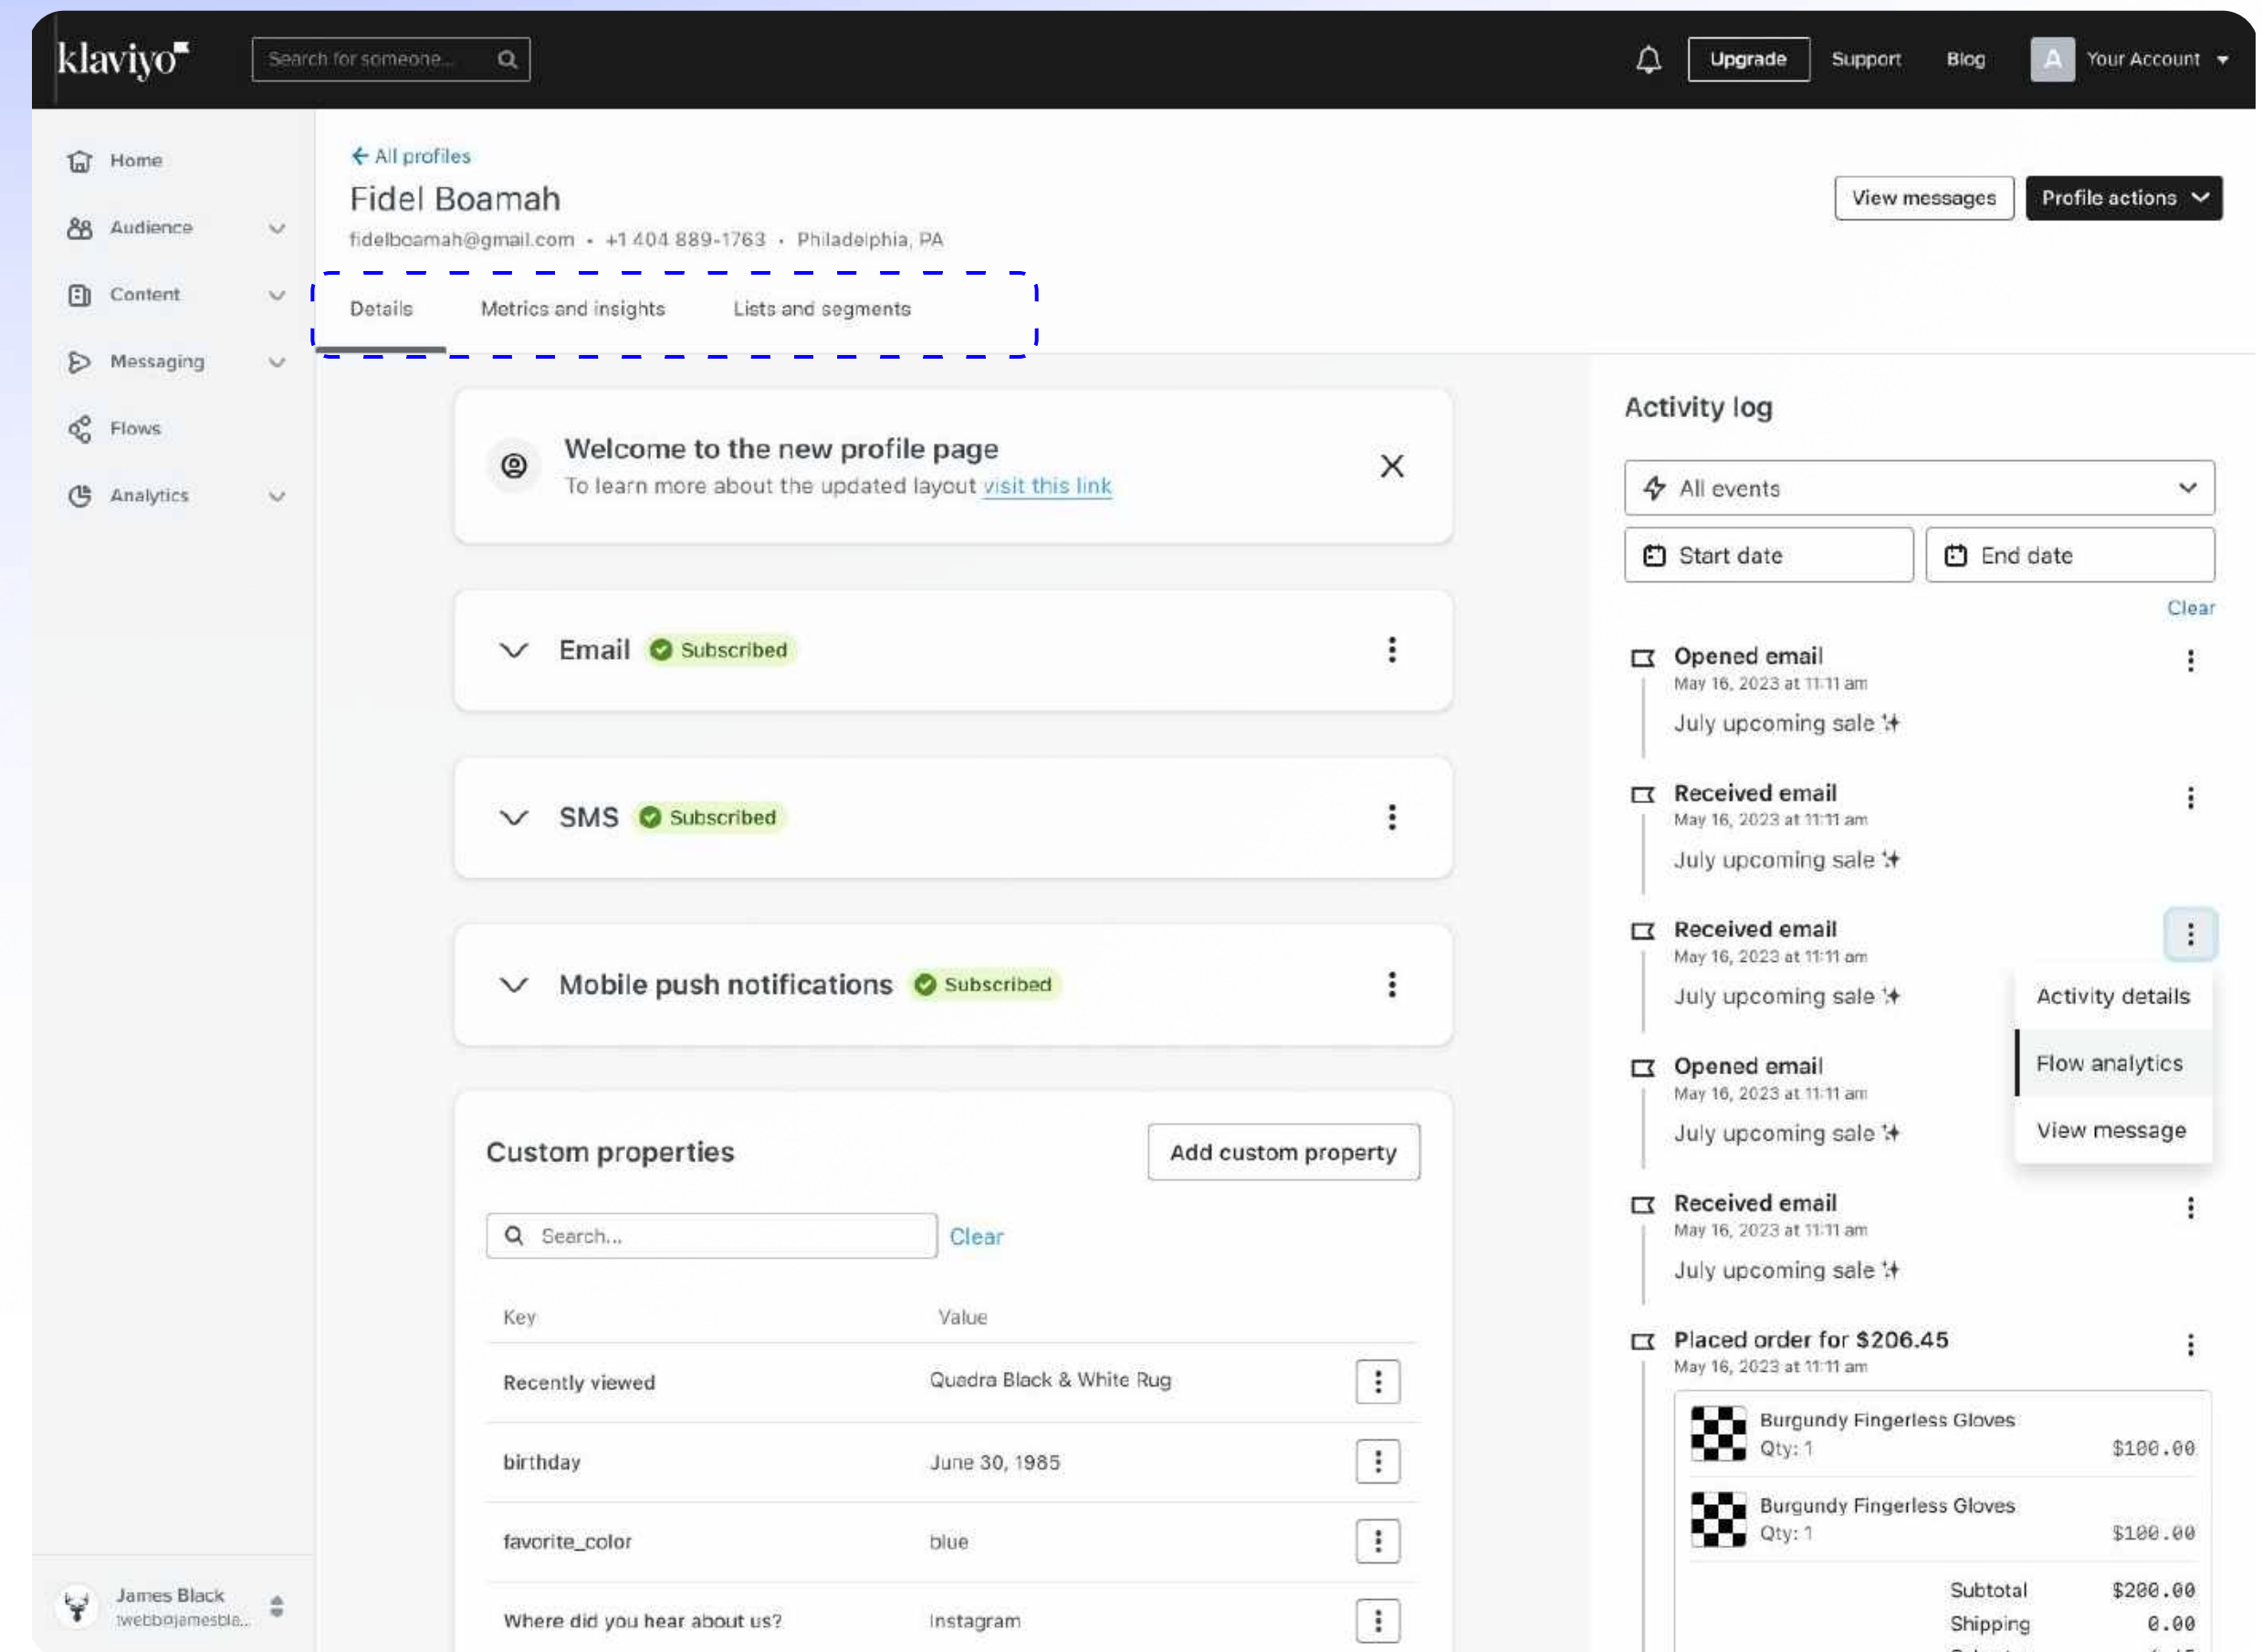

Organizing by user intent gave the page the hierarchy Layout 2 was missing.

Key Questions:

- Locked down the information architecture before exploring new layouts, starting with a support ticket analysis that showed users were overwhelmed by scattered data on the legacy profile
- Reorganized the page around user intent, separating dynamic actions in the Activity Feed from static attributes in Identity & Details
- Elevated Consent from the bottom of the list to the top of the new Details hierarchy

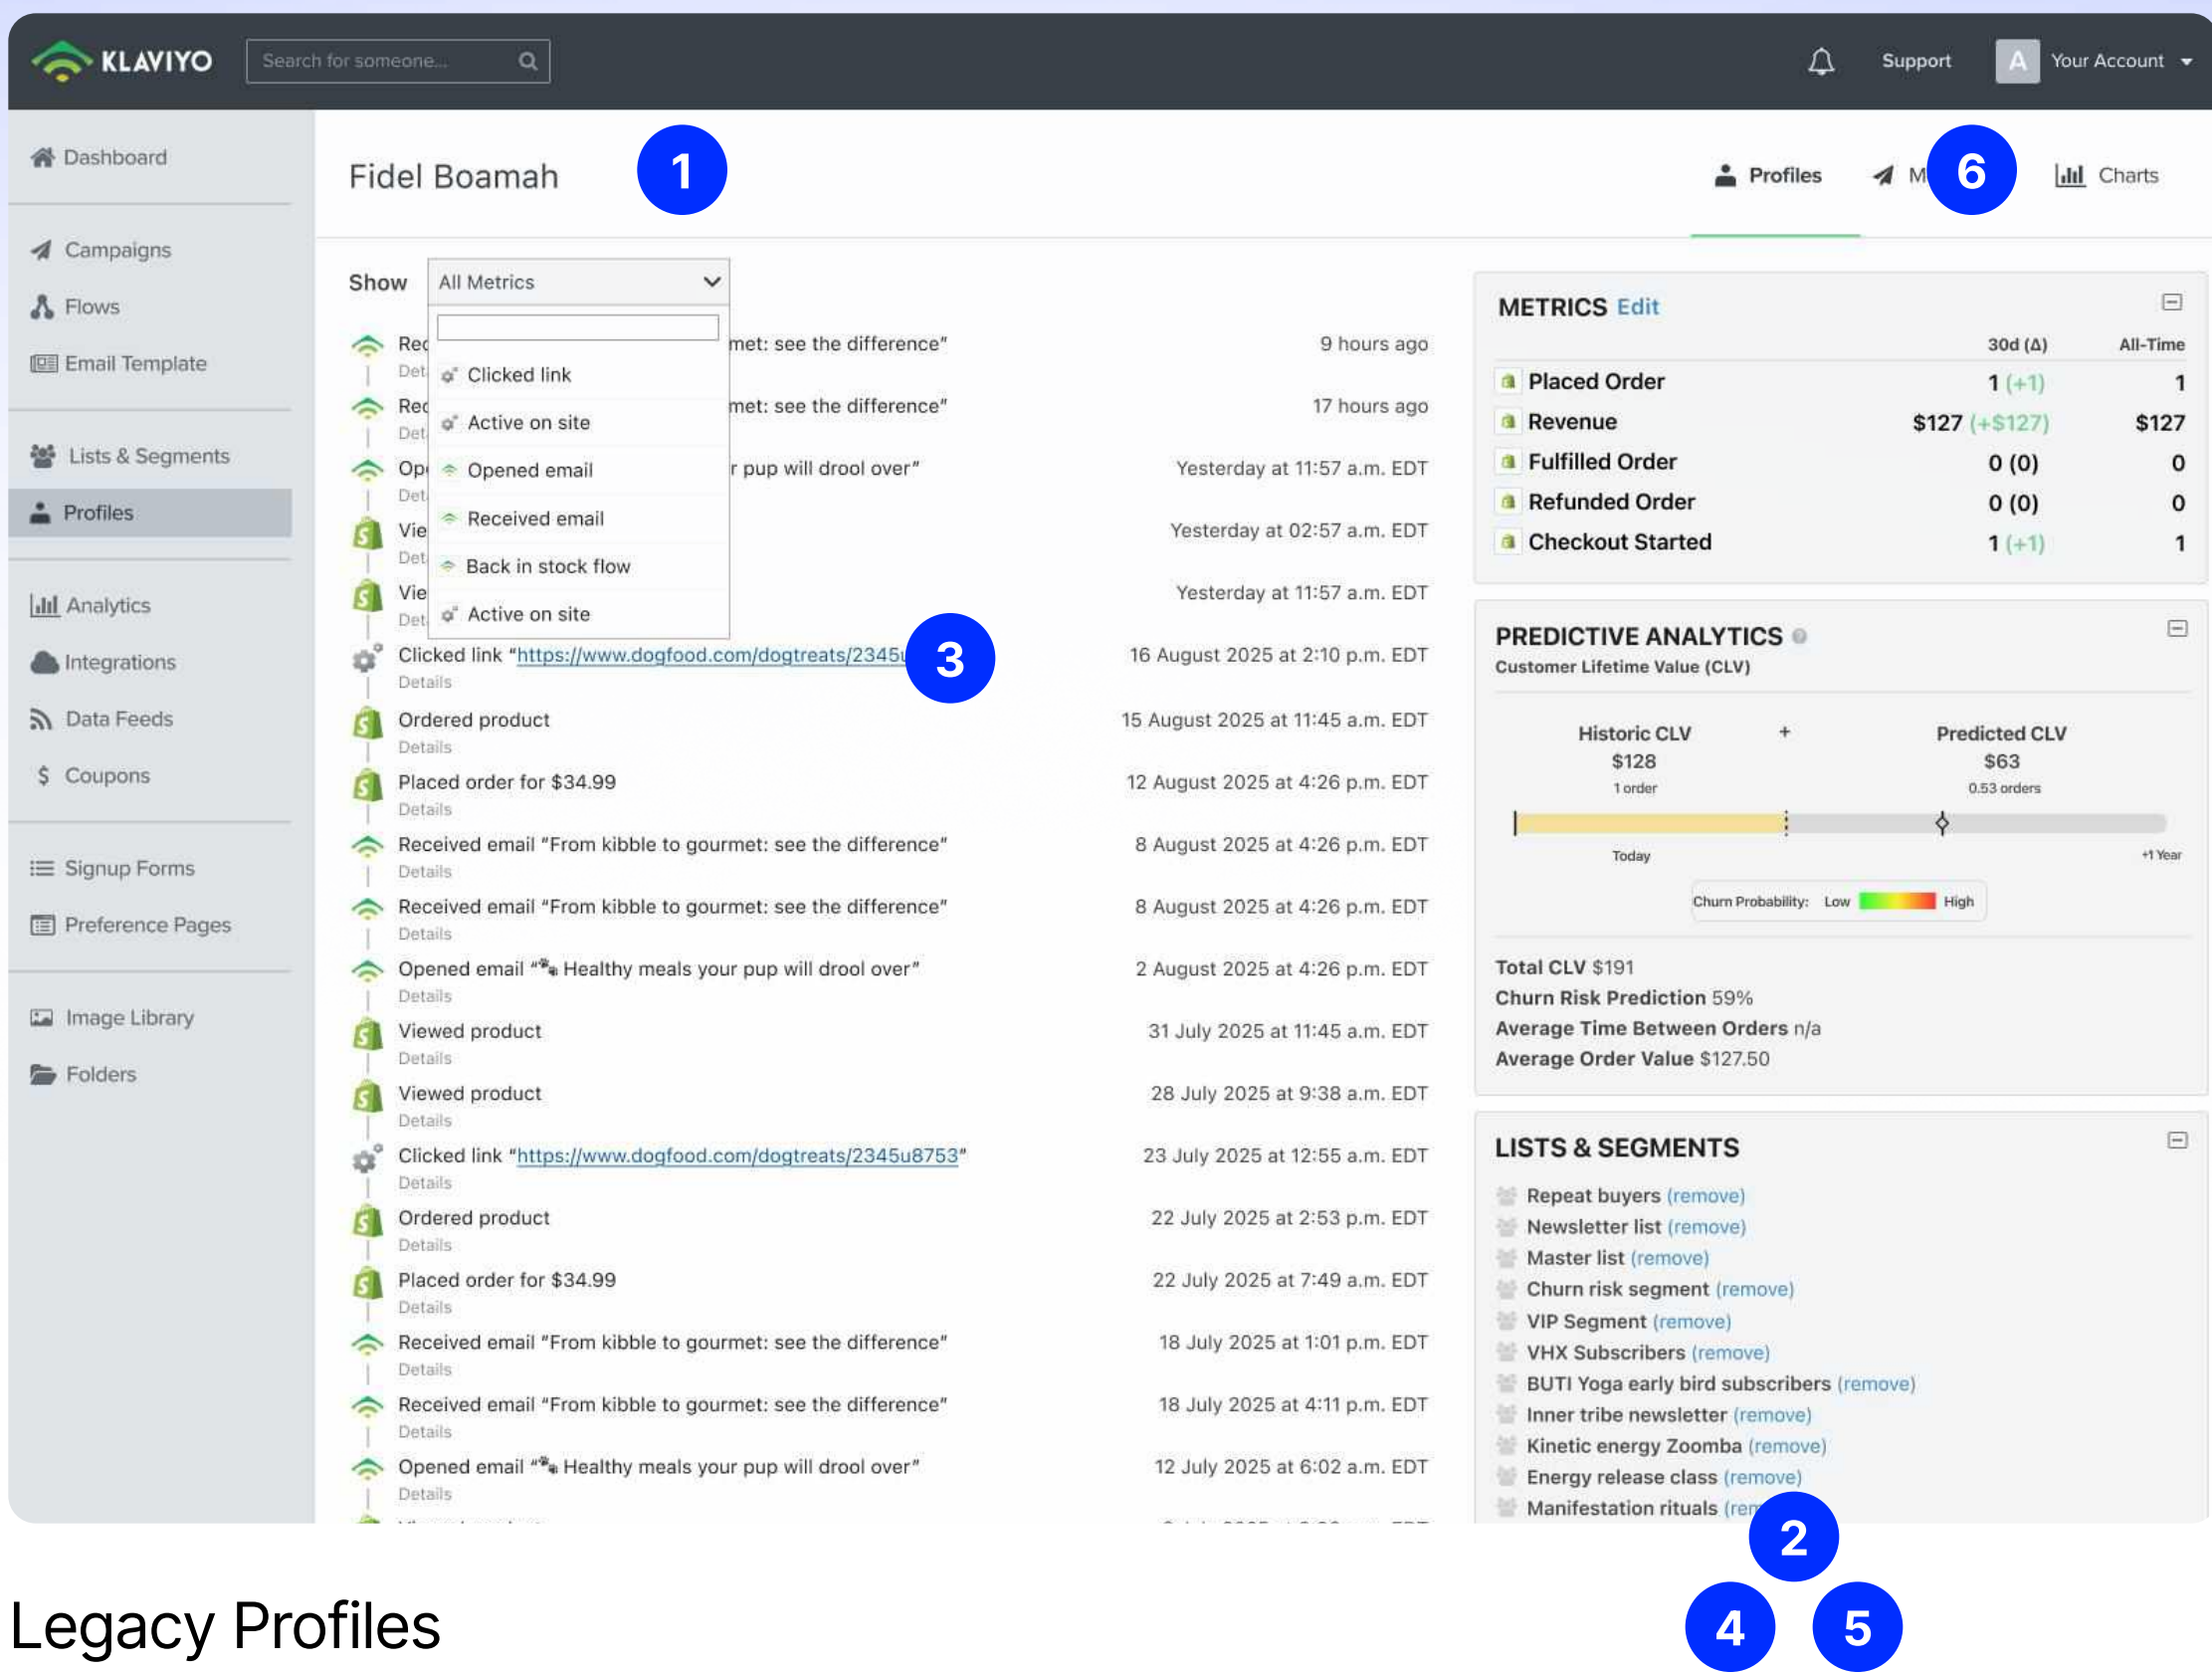

Takeaways:

- ✓ Grouping by intent gave the page the priority system Layout 2 was missing, so identity and behavior now lead instead of competing with everything else
- ✓ Users could verify compliance status at a glance, turning a buried field into a trusted checkpoint

Recognizing Remarkable Work

Fidel Boamah
Product Designer

Fidel led and supported the modernization and update of Klaviyo Profiles—one of the oldest areas in our product.

He consistently demonstrates strong critical thinking skills, excellent communication, and an infectious enthusiasm for tackling challenges and solving complex problems.

Insights

Speak in the Numbers Leadership Uses

Reframing the redesign in revenue terms, not design terms, moved it from a 1:1 migration to a funded redesign.

Muscle Memory Is a Requirement

Modernizing a decade-old product meant protecting the paths users already knew while improving everything around them.

Constraints Sharpened the Work

Design system compliance ruled out patterns we liked and pushed us toward solutions the whole product could reuse.

Opportunities

Profile Actions at Scale

The redesign fixed reading a profile. Acting on many profiles at once is the next unsolved half of the workflow.

Extend the Pattern

The persistent activity model applies to other detail pages in the product, not just Profiles.

Thank You
